

1. General Mechanics & Timeline Adjustments

- **Initial Guidelines vs. Kick-off Mechanics:** The guidelines originally published on the website prior to June 1 were intended to provide a generic, high-level overview of the competition's theme. The AI kick-off and briefing session were always designated as the official timeline to unveil and discuss the specific, granular mechanics and API integrations.
- **"Video of the Lore" Requirement:** To clarify, the video mentioned during the briefing was intended purely as a sample format. **An image will completely suffice** for this asset requirement if your team prefers not to produce a full video.
- **Deadline Extension:** We acknowledge that adapting to these technical mechanics takes time. To accommodate teams that submitted early or need to adjust their project scope, **we will be posting an official extension for the 50 percent cut-off for the deliberation and proposal submission.** This should grant your team the extra breathing room needed to refine your architecture.

2. Technical & Architecture Clarifications

To help align your development strictly with our vision, here are the explicit answers to your questions regarding the portal and data structures:

Question: Could the committee explicitly define the architectural, flow, and user-experience difference between the “City-wide Digital Portal” and “Digital Museum”?

The **Digital Museum** is the core interactive portal that our team is creating. It uses a data handshake to connect directly to your game, allowing the system to unlock the specific artifacts when players discover them.

The **Digital Portal**, on the other hand, acts as our overarching central repository—**think of it like a platform like Steam, and this portal will be provided entirely by the organizing committee.** It will serve as a public hub for all the games built in Region 6 to gather feedback from players nationwide. Inside this portal, there are collectibles, and once a player unlocks an item via your game's handshake with the digital museum, that artifact will permanently show up in the player's portal profile.

Sub-question: Will the digital portal be publicly accessible to everyone, regardless of whether they have played the game?

Yes. It will be completely publicly accessible to everyone. Its primary purpose is to act as a centralized repository for the Region 6 games and to actively entice and gather feedback from players across the country.

Sub-question: What data is needed for the digital portal and museum to work? How does the digital portal come into this scenario?

As noted above, the digital portal functions as the macro platform provided by us (the "Steam" environment), while the museum handles the micro-interactions of your specific

project. Your team will upload your "Hidden Artifact" into the digital museum system so it is ready to be triggered. When a player finds it in-game, the handshake validates the discovery and pushes that data to our digital portal so it can be tied to the user's broader platform profile.

We have implemented a game session per player system. per session links to a user account. This player will need to login to the game on app for their session to be a success

Sub-question: How does the tracking work when an artifact is found? Are we required to build a login/authentication feature into our game so players can connect their game accounts to your digital museum platform?

- we have an api endpoint that game developers will call to trigger the achievement that a user has found the artifact. it is their responsibility to use the endpoint to work (no need to create a login)

An official announcement regarding the exact extended dates and further technical documentation will be posted soon.
